IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

Anticipated Classification of this application:

Class: \_\_\_\_\_ Subclass \_\_\_\_\_

Prior Application:

Examiner: Maung, N.

Art Unit: 2744

Commissioner of Patents and Trademarks  
Washington, D.C. 20231

**CONTINUATION APPLICATION**

This is a request for filing a

Continuation

application of pending prior application

Serial No: 08/848,082, filed on 03/21/96

of Dennison, et al (inventors)

for CELLULAR TELEPHONE SYSTEM THAT USES POSITION OF A MOBILE UNIT

TO MAKE CALL MANAGEMENT DECIECTIONS

1. COPY OF PRIOR APPLICATION AS FILED WHICH IS ATTACHED

The copy of the papers of the prior application as filed which are attached are as follows:

37 pages of specification

16 pages of claims

1 page of abstract

19 pages of drawings

4 pages of declaration and power of attorney

my records reflect that the original signed declaration showing applicant's signature was filed on 12//91.

2. AMENDMENTS

Cancel in this application original claims 1-65 of the prior application before calculating the filing fee.

A preliminary amendment is enclosed (Claims added by this amendment have been properly numbered consecutively beginning with the number next following the highest numbered original claim in the prior application.)

3. FEE CALCULATION

CLAIMS AS FILED

Number filed	Number Extra	Rate	Basic Fee
			\$345.00
Total Claims 9-20 =	0 X	\$11.00 =	0.00
Independent 3-3 =	0 X	\$30.00 =	0.00
Total			<u>\$345.00</u>

4. SMALL ENTITY STATUS

A verified statement that this filing is by a small entity:

has been filed in the parent application and such status is still proper and desired (37 C.F.R. §1.28(a))

5. RELATE BACK

Amend the specification by inserting before the first line the sentence:

"This is a continuation application of SN 08/848,082 filed on 03/21/96 (pending), which is a continuation-in-part application of SN 08/555,884 filed on 10/23/95 (now Patent Number 5,546,445) which is a continuation-in-part application of SN

402,976 filed on 03/13/95 (now abandoned) which is a continuation-in-part application of SN 08/057,833 filed on 05/07/93 (now abandoned) which is a continuation of SN 07/813,494 filed on 12/26/91 and issued as Patent No. 5,235,633 (and re-issued as Re 35,916)."

#### 6. INVENTORSHIP STATEMENT

(a) With respect to the prior copending U.S. application from which this application claims benefit under 35 U.S.C. §120, the inventor(s) in this application is (are):

the same

(b) The inventorship for all the claims in this application are

the same

#### 7. ASSIGNMENT

The prior application is assigned of record to  
Sygent Communications, Inc.

#### 8. FEE PAYMENT BEING MADE AT THIS TIME

Enclosed

<input checked="" type="checkbox"/> basic filing fee	\$ <u>345.00</u>
Total Fees Enclosed	\$ <u>345.00</u>

#### 11. METHOD OF PAYMENT

enclosed is a check (Number ) in the amount of \$345.

#### 2. POWER OF ATTORNEY

The power of attorney in the prior application is to Terry M. Gernstein, Registration Number 26,891.

The power appears in the original papers in the prior application.

Address all future communications to

Terry M. Gernstein  
1015 Salt Meadow Lane  
McLean, VA 22101  
(703) 790-5945

I hereby declare further that all statements made herein of my own knowledge are true; that all statements made herein on information and belief are believed to be true; and further, that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code, and that such willful false statements may jeopardize the validity of this application or any patent issuing thereon.

VERIFIED STATEMENT (DECLARATION) CLAIMING SMALL ENTITY STATUS (37 CFR 1.9(F) AND 1.27 (b) - INDEPENDENT INVENTOR

As below named inventors, we hereby declare that we qualify as an independent inventor as defined in 37 CFR 1.9 (c) for purposes of paying reduced fees under section 41 (a) and (b) of Title 35, United States Code, to the Patent and Trademark Office with regard to the invention entitled:

CELLULAR TELEPHONE SYSTEM THAT  
USES POSITION OF A MOBILE UNIT  
TO MAKE CALL MANAGEMENT DECISIONS

described in the specification being filed herewith.

We have not assigned, granted, conveyed or licensed and are under no obligation under contract or law to assign, grant, convey or license, any rights in the invention to any person who could not be classified as an independent inventor under 37 CFR 1.9 (c) if that person had made the invention, or to any concern which would not qualify as a small business concern under 37 CFR 1.9 (d) or a nonprofit organization under 37 CFR 1.9 (e).

Each person, concern or organization to which we have assigned, granted, conveyed, or licensed or are under an obligation under contract or law to assign, grant, convey, or license any rights in the invention is listed below:

Syonet Communications, Inc.

We acknowledge our duty to file, in this application or patent, notification of any change in status resulting in loss of entitlement to small entity status prior to paying, or at the time of paying, the earliest of the issue fee or any maintenance fee due after the date of on which status as a small entity is no longer appropriate. (37 CFR 1.28 (b)).

We hereby declare that all statements made herein of our own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

RECORDED IN THE OFFICE OF THE CLERK OF THE DISTRICT COURT FOR THE DISTRICT OF COLUMBIA

VERIFIED STATEMENT (DECLARATION) CLAIMING SMALL ENTITY  
STATUS - SMALL BUSINESS

I hereby declare that I am

an official of the small business concern empowered to act on behalf of the concern identified below:

NAME OF CONCERN: SYGNET Communications, Inc.

ADDRESS OF CONCERN: 3930 Sunset Blvd., Youngstown, OH  
44512

I hereby declare that the above-identified small business concern qualifies as a small business concern as defined in 13 CFR 121.3-18 and reproduced in 37 CFR 1.9(d), for purposes of for purposes of paying reduced fees under section 41 (a) and (b) of Title 35, United States Code, in that the number of employees of the concern, including those of its affiliates, does not exceed 500 persons. For purposes of this statement, (1) the number of employees of the business concern is the average over the previous fiscal year of the concern of the persons employed on a full-time, part-time or temporary basis during each of the pay periods of the fiscal year, and (2) concerns are affiliates of each other when either, directly or indirectly one concern controls or has the power to control the other, or a third-party or parties controls or has the power to control both.

I hereby declare that rights under contract or law have been conveyed, to and remain with the small business concern identified above with regard to the invention entitled:

CELLULAR TELEPHONE SYSTEM THAT  
USES POSITION OF A MOBILE UNIT  
TO MAKE CALL MANAGEMENT DECISIONS

by Inventors: Dennison, et al

described in the specification filed herewith

I acknowledge my duty to file, in this application or patent, notification of any change in status resulting in loss of entitlement to small entity status prior to paying, or at the time of paying, the earliest of the issue fee or any maintenance fee due after the date of on which status as a small entity is no longer appropriate. (37 CFR 1.28 (b)).

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both , under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

Title: CELLULAR TELEPHONE SYSTEM THAT USES  
POSITION OF A MOBILE UNIT TO MAKE  
CALL MANAGEMENT DECISIONS

Hon. Commissioner of Patents and Trademarks  
Washington, D.C. 20231

Sir:

PRELIMINARY RESPONSE

Prior to initial examination, please amend the above-  
identified patent application as follows.

IN THE CLAIMS:

Please cancel Claims 1-65 inclusively, and add the following  
claims.

--66. A wireless radio communications system, such as a  
cellular telephone system, that includes a plurality of land  
based elements, one or more sources of data storage and at least  
one MTSO, and at least one mobile telephone unit, comprising:

- A) locating means in at least one of a mobile unit which can  
operate from a non-fixed location and a radio communications  
system for determining the exact geographic location of the  
mobile unit;
  
- B) management means for making data management decisions based  
on the exact geographic location of the mobile unit, said

management means including means for storing geographic data for each element and for making a comparison between the exact geographic location of the mobile unit and the land based data stored in said management means;

- c) means in said management means for making a data management decision based on said comparison; and
- d) means for routing a call from the mobile unit to an element selected by said mobile unit based on the exact geographic location of the mobile unit.

67. The wireless radio communication system defined in Claim 65 further including means for billing the mobile unit for the call based on a rate associated with the call to the selected element.

68. The wireless radio communication system defined in Claim 66 further including means for billing the mobile unit for the call, regardless of cell site location.

69. A method for making management decisions in a wireless radio communications system, such as a cellular telephone system, comprising:

- A) determining the exact geographic location of a mobile unit in a wireless radio communication system;

D  
E  
S  
I  
G  
N  
O  
R  
U  
M  
P  
A  
T  
E  
S  
C  
O

- B) storing the exact geographic location of each of a plurality of elements of the wireless radio communication system;
- C) at the mobile unit, selecting a desired service;
- D) in the MTSO, comparing the exact geographic location of the mobile unit to the geographic locations of the service elements in the wireless radio communication system which provide the desired service and selecting one of the service elements based on the comparison between the exact geographic location of the mobile unit and the selected service element; and
- E) routing the call from the mobile unit to the selected service element.

70. The method defined in Claim 68 further including a step of transmitting the exact geographic location of the mobile unit to an MTSO of the wireless radio communication system.

71. The method defined in Claim 68 further including billing the mobile unit for the call to the selected service element at a rate associated with the call from the mobile unit to the selected service element.

72. The method defined in Claim 68 wherein the mobile unit is passive during the step of determining the exact geographic location of the mobile unit.

73. The method defined in Claim 70 wherein said billing is made regardless of the location of a cell site.

74. A wireless radio communications system, such as a cellular telephone system, that includes a plurality of land based elements, one or more sources of data storage and at least one MTSO, and at least one mobile telephone unit, comprising:

- A) locating means in at least one of a mobile unit which can operate from a non-fixed location and a radio communications system for determining the exact geographic location of the mobile unit;
- B) means for requesting land based services for said mobile unit;
- C) management means for making data management decisions based on the exact geographic location of the mobile unit, said management means including means for storing geographic data for each element and for making a comparison between the exact geographic location of the mobile unit and land based data;
- D) means in said management means for making a data management decision based on said comparison;

E) means for identifying an element based on the exact geographic location of the mobile unit; and

F) means for automatically routing information based on services requested for said mobile unit.--

REMARKS

The above claims have been added to further define applicants' invention. All of the claims are fully supported in the specification as initially filed on 12/26/91 and this application relates back to that date and claims priority of that filing date.

An examination on the merits is requested.

Respectfully submitted,

  
Terry M. Gernstein

September 5, 2000

Technical Field of the Invention

The present invention relates to the general art of wireless over-the-air communication, which includes cellular mobile radiotelephone (CMR) technology, and to the particular field of managing communication processes in a wireless over-the-air communication system. The present application is a continuation-in-part of pending US Application Serial Number 08/555,884, filed 10/23/95 which is a continuation-in-part of US Application Serial Number 08/402,976, filed 03/13/95, which was a CIP of US Application Serial Number 07/813,495, filed 12/26/91, which is a continuation of US Application Serial Number 08/057,833, filed 05/07/93 which is a continuation of US application 07/813,494, filed 12/26/91 and issued as US Patent 5,235,633. The disclosures of each of these applications is fully incorporated herein by reference. Therefore, as used hereinafter, the term "prior art" refers to art that is relevant prior to the invention dates associated with this incorporated material.

Background of the Invention

The present invention is concerned with wireless over-the-air communication using a plurality of transmit/receive cell sites or relay points. It should be understood that the transmit/receive relay points can be either land based or non-land based, such as satellite based, and that as used herein, the term "cell site" or its equivalent refers to one of the relay points of the system. CMR (Cellular Mobile Radio) is an example of one type of wireless over-the-air communication system that

can be included in the present disclosure. It is understood that the term CMR is not intended to be limiting, but is merely used as an example for the purposes of discussion. It is also to be understood that the term "cellular telephone system" or its equivalents is intended to be shorthand notation for the term "wireless over-the-air communications system" and no limitation is intended by the use of the term "cellular." Also, as used herein, the terms "CD (Communication Device)" and "MU (Mobile Unit)" are intended to include any device used to communicate in the wireless over-the-air communication system. Also, the term "cellular telephone system" is used for purposes of discussion but can include any form of wireless over-the-air communication system. It is also noted that many forms of communication are and will be conducted over the wireless over-the-air networks.

Therefore, the present disclosure will refer to a "communication process" which is intended to cover calls as well as other forms of communication that can be conducted in this manner.

CMR is a rapidly growing telecommunications system. The typical CMR system includes a multiplicity of cells. A particular geographic area can be subdivided into a multiplicity of subareas, with each of the subareas being serviced by a stationary transmitter/receiver setup. The cells are set up to carry signals to and from mobile units in the range of the cell. If one cell site becomes too crowded, it can be divided into smaller cells, by a process known as cell site splitting. Any particular geographic area can become quite complicated with

cells overlapping each other, and overlapping cells of other neighboring cellular systems. Further, null zones with inadequate coverage, or even no coverage, can result. It is noted that the term "cellular" is intended to be a term of convenience, and is not intended to be limiting. The present disclosure is intended to encompass any communication system in which an overall area can be divided into one or more subareas, and also to any communication system having at least some portion of the communications occurring over the air.

A typical CMR set up is indicated in Figures 1 and 2, and will be described so an understanding of the problem to which this invention is directed can be obtained.

A typical cellular telephone unit having a unique mobile identification number stored in a suitable location such as an electrically erasable programmable read-only memory (not shown). Telephone units of this kind are known to those skilled in this art, and thus will not be described in detail.

The telephone unit includes a handset 4 having a keypad 5 as well as a speaker 6 and a microphone 7. A transceiver 8, ordinarily built into the telephone unit, exchanges signals via an antenna 10 with a mobile telecommunications switching office or MTSO 12 via a cell site 14. A duplexer 15 connects the antenna to the transceiver. The cell site 14 includes an antenna 16 connected to a control terminal 17 via a transceiver 18. The cell site 14 is connected to the MTSO via a transmission link 20. The Mobile Telephone Switching Office has historically been known as

the center of the wireless over-the-air communications system. It is where the communication process management decisions are made, billing records are produced and where maintenance activities are initiated for wireless over-the-air communications systems. The  
5 MTSO is not a specific piece of equipment, but is comprised of many individual pieces. The MTSO will contain a telephone switch, peripheral processors, adjunct processors, and various other information gathering equipment used in the operation and management of a wireless over-the-air communications system. Each  
10 of the different pieces of equipment may directly or indirectly be involved providing the highest quality connection possible.  
The makeup of the MTSO therefore comprises many different pieces of equipment and many components, which can be supplied by different vendors. Therefore, communication process management  
15 decisions made at the MTSO can actually be made outside of a switch and can be made in a cluster of nodes housed along the network or even in separate cell sites. Therefore, as used herein the term MTSO really refers to all of the systems, nodes, modules, equipment and components that combine to define a  
20 wireless over-the-air communication process management network, regardless of the physical or system location of these elements. The term MTSO therefore is not intended to be limiting to the "switching office" as it may have been viewed in the prior art. The term is intended to be much broader than that and to include  
25 any combinations of equipment, etc that may be connected within the communication processing network of the service provider. The

term MTSO is one of convenience and is intended to include all  
the information processing hardware and software associated with  
the wireless over-the-air communication process management  
process within a wireless over-the-air system, no matter where  
5 the hardware or software is located in the system. It is also  
noted that the term "intrasytem" refers to actions and  
components within a particular system; whereas, the term  
"intersystem" refers to actions and components located outside a  
particular system.

10 Referring to Figures 1 and 2, the operation of the CMR can  
be understood. The mobile unit M moves about the geographic areas  
covered by the various cells. As that mobile unit moves about, it  
decodes the overhead message control signals generated by various  
cell site control channels. The mobile unit locks onto the cell  
site that is emitting the strongest signal. The mobile unit  
15 rescans channels periodically to update its status. If, for  
example, a fixed-position land-based telephone T is used to call  
the mobile unit, a signal is sent via landlines L, to the central  
office CO of a public/switched telephone system (PTSN) 12A. This  
20 system then utilizes the switching network SN associated  
therewith to call the MTSO 12 via a transmission link L1. The  
MTSO then utilizes its own switching network and generates a page  
request signal to cell sites via transmission links, such as the  
transmission link 20. The cell site which has been notified of  
25 the presence of the mobile unit M sends a signal back to the MTSO  
via the landlines or wireless links alerting the MTSO of the

presence of the mobile unit. The MTSO then orders the mobile unit, via the notifying cell site, to tune to an assigned channel and receive the communication process.

On the other hand, during communication process origination,  
5 the mobile unit rescans the control channels to determine which is the best server based on signal strength. Upon selecting the best server, the mobile unit transmits cell site information on the control channel receive frequency and then receives a voice channel to tune to if the mobile unit is authorized to place a  
10 communication process.

As the mobile unit moves, the signal strength between that mobile unit and the originating cell site changes, and perhaps diminishes. Since signal strength is an inverse function of the square of the distance between the mobile unit and the cell site,  
15 signal strength can change rapidly and drastically as the mobile unit moves with respect to the cell site and therefore must be monitored closely. The MTSO has a signal strength table, and signal strength from the mobile unit is constantly compared to acceptable signal strength levels in the table. Such a table can  
20 be located in each cell site if desired.

Should signal strength diminish below a preset range, the MTSO generates a "locate request" signal to all cell sites that neighbor the original cell site. Each of such neighboring cell sites receiving a signal from the mobile unit signals the MTSO,  
25 and the signal strengths from such neighboring cell sites are checked against the signal strength table. The MTSO makes a

decision as to which cell site should control the communication process, and notifies the original cell site to order the mobile unit to retune to a voice channel of the new cell site.

As soon as the mobile unit retunes, the mobile unit  
5 completes the communication process via the new cell site  
channel. This transfer of control is known as a handoff.

Typically, governments grant rights to provide wireless  
communication services to a specified land area based on  
geographic boundaries. Since wireless propagation does not end at  
10 exact geographic boundaries, many conflicts have arisen between  
service providers as to which service provider should provide  
service at the location from where the Communication Process (CP)  
is being originated or received. Today, there are no methods or  
procedures to resolve these issues. A Communication Process (CP)  
15 can be defined as the exchange of information between  
communication devices, such as, but not limited to, Analog or  
Digital radiotelephones, digital data communications, analog or  
digital video, and the like.

When the initial wireless systems were built, they were  
20 constructed around major metropolitan areas. This created service  
voids between major metropolitan markets. In these early systems,  
boundary service problems did not arise because there were areas  
of "no service" buffering competing systems. Today, as rural  
systems fill in the patchwork of nationwide coverage, network  
25 service provision boundary disputes are becoming common. Prior to  
the Dennison, et al patent, US Patent 5,235,633 and the patents

and applications depending therefrom as continuations and continuations-in-part, the disclosures of which are fully incorporated hereinto by reference, and the invention disclosed herein, it was impossible to honor the exact geographic  
5 boundaries. Attempts are currently made to control coverage boundaries by installing directional antennas and adjusting cell site receive and transmit parameters. The methods used to match the system boundaries to the geographic boundaries are not entirely successful due to the variations in terrain, environment  
10 and limitations of antenna design and wireless propagation. A common result of these problems is inadequate wireless signal strength or null coverage and border disputes around the geographic boundaries and hence poor service.

The incorporated material, including the Dennison et al patent disclose that cell sites sometimes have overlapping coverage due to the aforementioned variations in terrain and environment, and propose a solution. While the proposed solution works well, there is still room for further improvement in the areas of cost, subscriber service, billing and taxing.

20 Furthermore, wireless propagation, such as but not limited to the cellular operating band of 800-900 MHz, is generally line-of-site transmission. This presents substantial challenges when choosing sites in which to place wireless transmit/receive antennas. Boundaries assigned to service providers are based on  
25 maps depicting the geographic borders of service boundaries. The question arises in a disputed territory of who will get to

service the Communications Process (CP). In the past, it has been the cell site that can provide the highest signal strength from the CD (Communications Device), not the provider that owns the legal territorial rights to the Communication Process (CP) that 5 has serviced the Communication Process (CP). Until the invention disclosed herein, the service provider that could receive the best signal would handle the communication process (CP), and depending on whether the Communication Process (CP) was handed off and/or depending on the agreement made between the wireless 10 communication systems, possibly keep all of the revenue from the communication process CP. Additionally, with real estate values being very high in established communities, cell sites are harder to construct and more expensive to build. Each cell site must be optimized for the maximum effective coverage area to overcome the 15 real estate problems encountered when constructing a cell site. This in turn creates problems with overlapping coverage between wireless systems and thus disputes over which wireless system handles the communication process. Further, due to business considerations, it may be economically advantageous for one 20 wireless system to own a cell site which is geographically located in the geographic area of another wireless system.

Cell sites are very expensive to install and maintain, so there is a very real savings for a service provider if fewer cell sites could be constructed while also improving coverage. Another 25 area that would be affected by this is problems of quality service. This is because the service provider has conflicting

requirements. To provide good coverage next to borders the provider would like to have high signal strength. To allow for hand-offs between cell sites and networks the signal strength needs to "fade out" at just the right level near the border to invoke a low threshold to start a hand-off process. It would be ideal to have high signal strength right up to a geographic boundary and then drop off beyond that boundary. However, at the present time, presently available systems do not permit this type of coverage.

Some areas inherently have wireless propagation problems, such as service areas next to bodies of water or in steep valleys. Wireless propagation can provide some very undesirable results for a number of reasons, some of which have been mentioned above and in the incorporated material. Therefore, there is a need to provide each network information as to which system has a right to handle a Communications Process (CP). For instance, a communications device (CD) might attempt to select a geographically incorrect service provider. Therefore, there is a need for a system that will permit a service provider to redirect the communication process to the geographically correct service provider, especially in a manner that is transparent to the Communications Device (CD) user.

Since cellular system geographic borders can be non-linear and can have irregular shapes, problems can arise. Problems associated with irregular boundaries are indicated in Figure 3. Figure 3 graphically shows the problem of obtaining coverage for

areas that have irregular boundaries. In this figure, areas A and C are serviced by Carrier X, and area B is serviced by Carrier Y. It is noted that areas A and C are intrasystem with respect to Carrier X and area B is intrasystem with respect to Carrier Y,  
5 while areas A and C are intersystem with respect to Carrier Y and area B is intersystem with respect to Carrier X. It is also noted that areas A and B could be covered by just one cell site each but the overlap into adjacent territories would be difficult to resolve. Today, areas such as these would be split into two or  
10 more cell sites. For instance, Carrier X might elect to install three cell sites A1, A3 and A4 which provides a minimum of overlap into area B. Overlap is indicated at the shaded areas. Therefore, there is a need for a system what would allow Carrier X to install a cell site with a larger coverage area such as A2  
15 (shown in dotted lines).

Figure 4 shows a prior art attempt of providing sectored cells. Using prior art technology requires installation of directional antennas to minimize the overlap into neighboring territory in order to resolve a border issue. Since these antenna patterns cannot be made to follow curved geographic borders,  
20 sectors are installed and directed for the best geographic coverage possible. This often involves obtaining a cell site location close to the border and "shooting back" toward the wireless communication system's own territory. This can leave  
25 null zones where cells back onto each other in an effort to keep signals from overlapping into neighboring territory. These null

zones will have either poor quality service or even no service at all, thereby resulting in poor service. Therefore, there is a need to overcome this problem as well.

Figures 5A and 5B illustrate a problem of how geographic terrain can affect prior art systems. In Figures 5A and 5B, a small rural network A is located just across the river from a large city C, which is part of a neighboring network B. The river defines the geographic and legal border between these two systems. The city C is in another state just across the river. In some river towns, there is a bluff on each side of the river. The network A can place their cell sites very near the border atop the bluff providing overlapping coverage into the city C. Network A will get all the service of the neighboring community D further away from the city C. Network A now has better line of cell site reception into the river valley with its corresponding traffic at river level than does network B who legally "owns" the territory. Network B would have to install additional cell sites in the river valley to obtain the same coverage. Due to the stronger signal level provided by Network A, Network A will process a communications process (CP). The result is that subscriber's Communication Process (CP) may not be processed by the correct service provider.

Note in Figure 5A that there are two service providers X and Y. The intersystem boundary is shown as a dashed line down the middle of the river. With a bluff on either side of the river, the cells can only service the opposite bluff. This is shown

where Y1 cell site cannot "see" the subscriber CD' hidden below. Cell site Y1 can however find CD3 in service provider X's territory. This issue denies revenue to the wireless communication system that has legal right to serve the

5 subscribers within its licensed geographic service boundaries.

Prior art systems are incapable of determining the geographic location of both the communications devices and their service boundaries and thus compromise quality of coverage. Therefore, there is a need to resolve this issue.

10 There is also need for providing a wireless over-the-air communication system with the ability to adjust its coverage and billing as the mobile unit moves. This will permit the system to determine taxes based on where the communication process is actually being made as opposed to the criteria used with the prior art. Still further, there is a need to permit a wireless over-the-air communication system to change frequencies as the mobile unit moves whereby a single wireless service provider can provide service to its subscribers regardless of frequency.

15 Still further, due to various business reasons, a single cell site may advantageously be used by more than one system. It will be necessary to determine which wireless communication system bills the communication process. Prior art systems cannot fully account for this.

20 Still further, if there is a service problem with a mobile unit, prior art systems are not able to accurately identify the exact geographic location of the unit when the problem arose.

This makes it difficult for the network to pinpoint coverage problems. Therefore, there is a need for a wireless over-the-air communication system that permits a wireless communication system to exactly and precisely identify the exact geographic location 5 of a mobile unit when a communication problem occurs.

Still further, with the advent of emergency response networks that use telephones, such as the E-911 systems, there is a need for a wireless over-the-air communication system that can precisely locate a mobile unit and pass that information on to an 10 emergency response system.

The location of an over-the-air system mobile unit making a communication process can also be of use to law enforcement agencies. However, signal strength from one cell site does not provide such location information with sufficient accuracy to be of the best assistance to law enforcement agencies. Therefore, 15 there is a need for an over-the-air communications network that can provide geographic location of a mobile unit during a communication process with accuracy sufficient to satisfy law enforcement agencies. This information should be rapidly 20 updatable so a mobile unit can be tracked.

Since the CMR industry is growing rapidly, competition is growing. Therefore, it is in the best interest of a system to be able to provide the best service possible to its subscribers. One way of achieving this objective is to customize the service to 25 the exact needs of each subscriber. This can be achieved by, among other things, customizing and varying a billing rate plan

for each subscriber. That is, the subscriber may be able to pay a lower rate when he is at work than he pays when he or she is at home. Therefore, there is need for a wireless over-the-air communication system that can vary rate plans and vary rates in a manner that will permit offering the best rate plan to each subscriber based on that particular subscriber's use and needs. Still further, some communication processes must be handled in a special manner to account for environmental conditions, or system needs, such as down time for a specific cell. Therefore, even if a communication process should be handled by a certain cell site, there may be times when that communication process must be handled by another cell site. Therefore, there is need for a wireless over-the-air communication system that can account for special circumstances associated with a communication process, and alter the system response when the mobile unit meets the criteria for those circumstances, even if the communication process is already in progress when the criteria are met.

#### Objects of the Invention

It is a main object of the present invention to provide a wireless over-the-air communications system that will permit a wireless communication system to determine the most efficient and accurate service to a mobile unit.

It is another object of the present invention to provide a wireless over-the-air communications system that will permit a wireless communication system to accurately bill a subscriber.

It is another object of the present invention to provide a

wireless over-the-air communications system that will permit a wireless communication system to accurately determine taxes for a subscriber for that subscriber's use of the system.

It is another object of the present invention to provide a  
5 wireless over-the-air communications system that will be able to handle all communication processes legally permitted it.

It is another object of the present invention to provide a  
wireless over-the-air communications system that will be able to  
handle all communication processes legally permitted it and to  
10 forward communication processes that rightfully belong to another  
wireless communication system while retaining billing and taxing  
of any portion of the communication process that belongs to it.

It is another object of the present invention to provide a  
wireless over-the-air communications system that will be able to  
handle all communication processes legally permitted it based on  
15 geographic constraints.

It is another object of the present invention to provide a  
wireless over-the-air communications system that can bill a  
subscriber based on the geographic location of communication  
process origination, and then can update and alter that billing  
20 as the mobile unit moves.

It is another object of the present invention to provide a  
wireless over-the-air communications system that can co-operate  
with other wireless networks in handling a communication process.

25 It is another object of the present invention to provide a  
wireless over-the-air communications system that can share cell

sites with other networks while retaining its ability to bill and service its own subscribers.

It is another object of the present invention to provide a wireless over-the-air communications system that can provide the  
5 most efficient and effective service to its subscribers and users.

It is another object of the present invention to provide a wireless over-the-air communications system that can update any communication process management parameter to account for  
10 instantaneous geographic location of a mobile unit.

It is another object of the present invention to provide a wireless over-the-air communications system that can assign and re-assign a communication process according to the location of the mobile unit during the communication process.

15 It is another object of the present invention to provide a wireless over-the-air communications system that can share geographic boundaries with other wireless over-the-air service providers without border issues.

20 It is another object of the present invention to provide a wireless over-the-air communications system that can change and update its operating frequencies during a communication process.

It is another object of the present invention to provide a wireless over-the-air communications system which can have the highest possible signal strength at its borders.

25 It is another object of the present invention to provide a wireless over-the-air communications system which can identify

the location of a mobile unit when a service problem arises.

It is another object of the present invention to provide a wireless over-the-air communications system that can efficiently work with emergency service providers.

5 It is another object of the present invention to provide a wireless over-the-air communications system that can efficiently implement and utilize special rate plans.

It is another object of the present invention to provide a wireless over-the-air communications system that can efficiently  
10 implement and utilize special requirements for a communication process.

It is another object of the present invention to provide a wireless over-the-air communications system that can establish parameters for updating mobile unit information based on the particular needs of the mobile unit.  
15

It is another object of the present invention to provide a wireless over-the-air communications system that can establish time and/or distance parameters for updating mobile unit information based on the particular needs of the mobile unit.

20 Summary of the Invention

These, and other, objects are achieved by a CMR system that allows the Exact Geographic Location (EGL) of a communications device to be tracked and compared to geographic land data and information data and to continuously update this information  
25 during the communication process whereby the proper and most efficient service is provided, including proper communication

process management and billing decisions. Within the scope of  
this invention is the ability to solve the above-mentioned  
problems and achieve the above-mentioned objects. By knowing the  
exact geographic location of a mobile unit during a communication  
5 process, competing service providers can locate their cell sites  
anywhere where the wireless reception will allow them to provide  
the best wireless coverage of their territory. The cell sites can  
even have overlapping coverage, or be inside an adjacent wireless  
communication system's coverage area. By knowing the location of  
10 the calling device at all times during the communication process,  
the wireless over-the-air communication system can configure the  
system to work together with other systems and wireless  
communication systems to process a communication process  
correctly. Service can be provided by the proper licensed  
15 wireless communication system because the exact location of the  
mobile unit is known at all times during the communication  
process. Propagation patterns and the like are not needed.

By way of background, the operation of a cellular system 20  
is shown in Figures 6, 7 and 7A. The cellular system 20 uses  
20 positional data associated with the mobile unit M' to make  
communication process management decisions. To this end, the  
cellular system 20, while similar in all other respects to the  
cellular system illustrated in Figures 2 and 3, includes means  
25 for accurately and precisely determining the exact position of  
the mobile unit M', and then further includes means for using  
this positional information to determine which cell site is best

suited to handle a communication process associated with that mobile unit M'.

The means for accurately determining the precise position of the mobile unit includes a Global Positioning System. The GPS includes satellites, such as satellite 22 in geostationary orbit about the earth. Each mobile unit further includes a GPS receiver 24 located between the duplexer and the logic circuitry 25 of the mobile unit. The GPS receiver communicates with the satellite 22 and the exact longitude and latitude of the mobile unit are determined. This information is sent to the MTSO via a cell site, and the MTSO uses a look-up table such as disclosed in Figure 9, to determine which cell site is most appropriate for use by the mobile unit. The mobile unit communicates with cell sites using unused bits of the aforesdiscussed overhead messages to send its positional information to the MTSO when the mobile unit is first activated. This positional information is relayed to the MTSO by the first cell site to communicate with the mobile unit. The MTSO then selects the cell site most appropriate for the mobile unit and hands that mobile unit off to that cell site. The cell sites transmit system service boundaries in their overhead messages that are interpreted by mobile units. The mobile units use the location information supplied by the GPS receiver as opposed to signal strength to determine which system to originate on. Communication process termination can utilize the paging process as is currently utilized. A response from a mobile unit includes the location information, and the designated control channel

instructs the mobile unit to tune to one of its channels. A communication process in progress utilizes the overhead message of the voice channel to communicate location information. Once a mobile unit that is processing on a particular cell site crosses  
5 a cell site boundary, it is instructed to perform a handoff to the cell site that is to service the new location. It is understood that the GPS is used as an example of the preferred source of positional data; however, other sources similar to the GPS can be used without departing from the scope of the present  
10 invention. All that is required is that the source of positional data be able to generate precise and accurate locational data on a fixed or a rapidly moving object. It is also helpful, but not absolutely required, that in some circumstances, such as triangulation, the CMR be only passively involved in the  
15 determination of the positional data.

The handoff process is similar to the present handoff processes, except it will be controlled according to position of the mobile unit instead of signal strength. This position information is used to determine communication process rating and taxing  
20 for billing purposes and communication process routing to make sure that the proper services for that location are provided.

A "locate request" signal is not used, since the exact location of the mobile unit is known to the MTSO. However, a signal strength method can also be used in making communication process management decisions if suitable. Such a process would be  
25 used if the mobile unit moves into a prior art cellular system.

The hereinafter disclosed system has many advantages over the prior art systems. Multiple layers of information can be generated and used. The system using the invention disclosed herein and in the incorporated material may use many levels of mapping such as cell site selection, taxing, billing, special rate plans, and the mapping of E-911 calls to an appropriate service provider.

Brief Description of the Drawing Figures

Figure 1 illustrates a typical prior art mobile cellular telephone and its link with a fixed cell site and an MTSO.

Figure 2 illustrates a typical prior art cellular system in which a mobile unit can be connected with a fixed-position unit.

Figure 3 illustrates an overlapping boundary problem with prior art systems as well as a fading signal at the borders.

Figure 4 illustrates a null zone problem associated with prior art systems.

Figures 5A and 5B illustrate boundary issue problems between two prior art systems separated by a natural boundary, such as a river.

Figure 6 is a block diagram of a mobile unit of a wireless over-the-air communications system which incorporates a GPS location determining system embodying the present invention.

Figure 7 illustrates a wireless over-the-air communications system incorporating a GPS position locating system for a mobile unit communicating with other units, such as the fixed-position unit shown.

Detailed Description of the Preferred Embodiment of the Invention

A representation of the logical flow that may occur in a wireless communications system incorporating the use of exact 10 geographic location (EGL) for the communication process management decisions is shown in Figures 8-10. The communication process management decisions are based on information provided by the communication device (CD) towards the fixed system and to the communications device from the fixed system. The description of a sample communications process (CP) begins upon the powering up of 15 the communicating device and continues until that communications process is completed.

When a communications device is powered up, block 101, the registration process, block 102 is initiated. The registration process is detailed in Figure 9. The first step in the 20 registration process, block 102 is to determine the exact geographic location, block 201 of the communications device via either GPS, block 202, signal strength, block 203, Loran, block 204, triangulation or other similar location means. The 25 information is used by the initial (Home) serving system and the exact geographic location (EGL) is compared to the service

boundaries, block 205 for that home system. A determination is made as to whether or not the Communications Device (CD) is located within the serving system's boundaries via the means of communication data filed in the serving system, block 206. The  
5 communication data may include computerized latitude and longitude tables which are then compared to geographic location tables of service allocation. In the absence of comparative tables, algorithms may be run to determine the mapping of exact geographic location (EGL) to service boundaries. If the  
10 Communications Device (CD) is located within the serving system's boundaries, the exact geographic location (EGL) is re-established, block 216 and recorded, block 217 for billing or other purposes. If the Communications Device (CD) is determined to be located outside of the serving system's boundaries, then  
15 the exact geographic location (EGL) is compared to the neighboring system boundaries, block 208 and block 212 on an interactive basis until the system that is authorized to serve the Communications Device (CD) at the current exact geographic location (EGL) is determined. In addition to the reference tables  
20 that assign the service provider, the communication data, blocks 209, 213 also identifies the means of transferring control of the Communications Device (CD) from one system to another. Once the correct system is identified, the Communications Device (CD) is commanded to establish communications with the proper cell site  
25 within the correct system 211, 215. An example of this would be commanding the Communications Device (CD) to tune to the

neighboring system's control channel. A registration increment timer 103 is then sent to the Communications Device (CD) informing it of the intervals 104 at which re-registration is required. This registration process is continued through the 5 period that the Communications Device (CD) is not in a Communication Process (CP) active state.

If a Communication Process (CP) were initiated then the registration process, block 106, Figure 9, would take place to update the exact geographic location (EGL). Once the exact 10 geographic location (EGL) is established the routing selection for the Communication Process (CP) is begun, block 107. Figure 9B shows that the first step is to identify the Communications Device (CD), block 401 so that the service characteristics, block 402 can be identified. A determination is then made as to whether 15 or not service is to be provided, block 403. If service is to be provided proper routing is selected, with the most appropriate communications path to connect point A to point B is selected for the specific communication process based on the exact geographic location (EGL) of the Communications Device (CD), block 404. This 20 may include activities and decision to route communication processes through land based networks, microwave, fiberoptic links and the like to allow for cost effective or expeditious connections to be established. If service is to be denied, the wireless communication system can direct the communication 25 process to the appropriate announcement, block 405 and if the Communication Process (CP) being initiated is determined not to

be a 911 emergency call, block 406. If a communication process is determined to be a 911 emergency call, then the system identifies the proper routing of the emergency communication process, blocks 407, 408 and 409, and the communication process will be directed 5 to the proper emergency response system. The routing of this emergency call should be accompanied by all of the information that is pertinent and available, blocks 410 and 411. If the exact geographic location (EGL) continues to change, updates should be sent to the serving emergency response system, block 412. If 10 another emergency response system needs to gain control of the call, the system will be able to establish a connection with the new emergency response system, block 413. This event is then recorded upon completion, block 414.

With communications established (Figure 8), block 108, the exact geographic location (EGL) may be stored for Communication Process (CP) management, billing purposes, and other identification needs, block 114. The stored exact geographic location (EGL) is then recorded for establishing the origination point for billing purposes, block 109, emergency 911 call 20 accounting, block 110, taxing purposes, block 111, rating the Communication Process (CP), block 112, or post communication → process subscriber service, block 113. The Communication Process (CP) rating process shown in Figure 9A identifies the subscriber characteristics, blocks 301 and 302. The recorded exact 25 geographic location (EGL) is then compared to the Communication Process (CP) rating table, blocks 303 and 304 to select the

correct rating, block 305 for that communication process (CP). This information is then recorded for later processing which may include application of taxes, Communication Process (CP) billing rates, or any other information which could be matched to the exact geographic location (EGL) of the communication process (CP). As the Communication Process (CP) continues, the exact geographic location (EGL) is constantly updated, block 115 or alternately updated at various intervals, block 114a, which intervals can be changed based on the time and/or distance traveled by the mobile unit to meet system needs for efficient communication process management, and these updated Communications Device (CD) locations are used for Communication Process (CP) management, block 116, billing decisions, block 119, and other real time processing uses, such as 911 emergency calls made while a non-emergency communication process was in progress, block 120, taxing, block 121, Communication Process (CP) rating, block 122, subscriber service, block 123, and frequency selection, block 124. The intervals at which the updating occurs can be determined on a preset time, such as every minute, or can be determined according to distance traveled by the mobile unit, such as every twenty miles, or the interval can be set according to the nearest border so that the mobile unit will be monitored whenever it reaches a location that would cross over the border if the mobile unit traveled toward that border. In this manner, the billing information, the tax information and the frequency of the communication process can be based on the location of the

communication process origination, but can also be continuously updated and changed as the mobile unit moves during the communication process whereby the exact rates and frequencies at any instant during the communication process can be applied to  
5 the communication process. As was discussed above, this will even permit separate networks to share cell sites as even though a single cell site handles a communication process, the location of the mobile unit will determine which system receives credit for the communication process and will handle the billing and taxing  
10 of the communication process. Alternatively, this will permit separate cellular systems to locate their own cell sites within the geographic area of another cellular system, and may even permit several different systems to share a single cell site.

The cell site can re-direct a communication process to another cell site under certain circumstances. For example, even though a particular cell site is chosen to handle a communication process, there may be special circumstances associated with a particular location that dictate all communication processes from that location be handled by a certain cell site. Special  
15 environmental conditions may be one such special circumstance, cell sites under repair may be another special circumstance or other business reasons may dictate such re-directing of communication processes. This redirecting can also occur for cellular systems. That is, if a selected cell site is not owned  
20 by the cellular system having rights to the communication process made by the mobile unit at that particular location, the  
25

communication process could be redirected to another cellular system. In this manner, customization of cellular service can be maximized with billing, taxing, frequency and the like all being selected according to the exact needs of the mobile unit during 5 the communication process, and changed as the needs of the mobile unit change during the communication process. As discussed above, the preferred means for establishing the exact geographic location of the mobile unit includes a satellite communications system; however, other means can also be used.

10 All of this data collection and monitoring continues until the Communication Process (CP) is completed, block 117. When the Communication Process (CP) is complete, and exact geographic location (EGL) of the mobile unit is recorded for various data processing uses prior to the data record closure, block 118.

15 Figure 10 shows how the billing information is passed along through an external billing system. The MTSO first generates Automatic Message Accounting (AMA) files, usually in magnetic tape format, which holds all the detailed records for communication processes processed from a particular MTSO during 20 that billing period. The AMA records are then processed (formatted into database readable media) at the wireless communication system's billing center which emerge as Call Detail Records (CDR). Call Detail Records are the detailed accounting of all the communication processes assigned to a subscriber's account. The roaming and home reports are combined which are then 25 processed as subscriber bills. It is here in the prior art system

that any taxes may be applied by the service provider or by the wireless communication system. Ideally, taxes should be assessed based on the location of the mobile unit when service is provided. This is not the case with prior art systems. For  
5 example, home communication processes are taxed according to either the billing address of the subscriber or the zip code or business address of the service provider and roam communication processes, that is communication processes made using a cell site that is not in the mobile unit's home area, are taxed based on  
10 the billing address of the roam network or where the cell site is located that services the communication process. Any tax based on the cell site location has the possibility of being in error, especially if the cell site is located adjacent to a border. The prior art has failed to teach the distinction between fixed  
15 location of hardware and exact geographic location (EGL) of the Communications Device (CD) for billing.

In the present system, the wireless communication system will obtain the instant location of the Communications Device (CD) at the registration process (Figure 9). In a system where  
20 bills are processed externally, billing information combined with the location of on the Call Detail Records can then be compared to lookup tables or algorithms that will assess the proper tax or billing rate depending on the location (origination, termination, duration, instantaneous location, or the like) of the  
25 communication process.

If needed, the billing location codes could be recorded at

some given interval (perhaps, for example, every minute, or after  
the mobile unit has traveled a certain distance) that would allow  
for updates and changes to the billing code as the Communications  
Device (CD) moves through different territories or beyond interval  
5 distances which can be calculated directly in a GPS system or  
indirectly via vector calculations in other systems.

One of the additional features that can be provided by the  
system of the present invention is real time subscriber service  
(Figure 8, block 123). Knowing the location of the Communications  
10 Device (CD) is important to the wireless service provider to help  
solve some service problems associated with the wireless network.

Although billing and taxing issues are important to current  
land based wireless communications systems service providers, these  
issues will be even more important for satellite systems (see Figure  
15 17) because the footprint of a satellite can cover many states or  
even different small countries such as in the European Community,  
with enormous tax generating capacity. With GPS location devices or  
Loran-C or any other type of location technology used to locate the  
satellite mobile phones, the problem can be avoided using the system  
disclosed herein. The exact geographic location of each subscriber  
20 unit will be carried along with voice transmission to allow location  
of the billing unit to be determined for tax assessment billing.

The advantages realized by the present invention can also be  
understood by comparing Figures 3-5 to Figures 11-16.

25 Figure 11 shows the identical borders and cells as shown in  
Figure 4. However, this time omnidirectional antennas are shown

which improve coverage but can cause overlap into a neighboring system. This overlap can be handled as described above by each network having independent intersystem cells which map the exact geographic location (EGL) of the Communications Device (CD) to determine which system will service the CP.

5

Figure 13 shows still another configuration which could be utilized where borders are concerned. Two or more bordering service providers could erect single cells on or very near the border. Since the systems will track the exact geographic 10 location (EGL) of each communications device (CD), it will know which service provider to connect the Communication Process (CP) to. This system uses a routing processor after the Communication Process (CP) has been accepted.

15  
Figure 14 shows a situation where the cell site from a competitive service provider is inside their borders. As shown, cell site Z3 is in place in service provider Q's territory. Communications Devices which are physically located inside territory Z which come up on cell site Z3 (communication device CD13) will be accepted. Communication device CD14 which will come 20 up on cell site Z3 will be redirected to the control channel of cell site Q2 since it lies within territory Q.

25  
Figure 15 shows the same territory depicted in Figure 3 which in the prior art had many cells and many border overlap issues, which resulted, in prior art systems, in the service providers adding smaller cell sites to break up the coverage into smaller sells. Figure 15 shows what can be done with the

inventive system to reduce the number of cell sites. By having fewer cells, they will have to be of higher power which allows for better signal strength out at the borders. By using the inventive system to manage the Communication Process, the correct system will handle communication processes even under conditions of overlapping coverage into a neighbor's territory. To illustrate this, the signal values are shown in Figures 3 and 15 for cell site coverage of cell sites A1 and B1. In the prior art system (Figure 3), each service provider will adjust its cell site to give some predetermined signal strength at the border. As an example, this value is shown as -5dB. This value will be as close to the border as possible to invoke a hand-off to the neighboring service provider (Note, communication device CD5 is at signal strength levels, A1=-2dB, B1=-5dB). However, the weaker the signal, the poorer the service such as terminated communication processes. However, if a contrast is made with the signal strengths in the inventive system, it will be found that higher values at the borders can be maintained which results in better service. For example, communication device CD6 signal strength A1=1dB, B1=5dB. Since most borders are straight lines and wireless communication sometimes propagates in a radial fashion, prior art service providers cannot simply increase the cell site's power to provide higher signal strength values at the borders. Therefore, if a provider sets a cell site to hand off at a certain value, it will hand-off wherever the signal strength decreases to that level, which may be a radial curve, which most

times may not follow the geographic service boundaries.

Therefore, as can be seen from the figures, if the provider were to increase the signal strength in an area, it may result in more overlap. This overlap is not a problem with the inventive system since the service boundaries are mapped to the exact geographic location (EGL) of the communications device (CD).

An example of another advantage realized with the present system is that all communication processes may be processed through the tax data base, but the wireless communication system may have a select group of subscribers that are identified to pay a certain billing rate in a specified geographic area which would constitute an additional loop through another look-up table. For example, as indicated in Figure 16, company A has negotiated for an attractive airtime rate within its plant's boundaries. This plant also resides in school district B which has assessed its own tax. The company employees will therefore enjoy the attractive rates while inside the plant and must pay the school tax on those communication processes. But if those employees go beyond the plant, they will lose the lower rate. For instance, communication device CD8 may have a low pre-negotiated rate, but pay school district B and state P taxes. Communication device CD9 pays the school district B and state P taxes, and communication device CD10 pays only the state tax. Billing is continuously updated no matter where the communication process originated as the mobile unit moves.

Still another application for the technology of this

invention could encompass the switching of a dual frequency phone to a second frequency based on exact geographic location (EGL) of the communication device (CD). An example of this would be switching from 800-900 MHz to 2 GHz frequencies used in the 5 upcoming PCS system. This would be useful for the commuter who wants PCS for his Communications Device (CD) in the city and to be able to roam out of PCS territory into cellular territory. It may even come to the time when subscribers are given rate plans that correspond to different zones, such as a 2000 foot perimeter 10 of their residence which would be billed at a residence rate, and be billed at a Home market rate beyond that. Still further, when the subscriber enters into the geographic zone of his or her employer, the MTSO will forward his business communication processes to his communication device (CD), all based on his 15 present exact geographic location. This could be an important competitive advantage to a service provider that owned the 900 MHz in one area and the 2000 MHz rights in a second area. For example, Figure 16 shows service provider A, which owns the license to 2000 MHz in territory 1, the 900 MHz license in 20 territory 2 and the 2000 MHz license in territory 3. When mobile unit CDX travels on roadway XR, it will pass through all three territories. The service provider would like to handle all the billing revenue for its subscribers travelling through territory 2, but does not have the 2000 MHz license in that area. 25 The communication device CDX is therefore instructed to retune to 900 MHz in territory 2 because System A does have rights to

communication processes in territory 2 at the 900 MHz frequency. This allows System A to by pass System B even though the System B is a 2000 Mhz service provider adjacent to two System A territories.

5       The preferred means for establishing exact geographic location (EGL) is a satellite communication system such as discussed in the incorporated material. However, other means, including, but not limited to, triangulation and the like, can be used without departing from the scope of the present invention.

10      It is understood that while certain forms of the present invention have been illustrated and described herein, it is not to be limited to the specific forms or arrangements of parts described and shown.

DRAFT DRAFT DRAFT DRAFT DRAFT

CLAIMS

1. In a wireless over-the-air communications system that includes one or more cell sites, an MTSO, locating means in the cellular communications system for determining the exact geographic location of a mobile unit and for providing a position signal of said exact geographic location, means in the MTSO for recognizing the position signal and using that position signal to establish the exact geographic location of the mobile unit, and data means in the MTSO for defining billing information for said mobile unit based on the exact geographic location of the mobile unit, said data means including tables containing billing information and positional data and means for comparing the exact geographic location of said mobile unit to the tables and assessing charges to said mobile unit based on said exact geographic location and for generating a communication process record for billing purposes, the improvement in combination therewith comprising:

means in said data means for providing billing information based on the location of the mobile unit when a communication process is originated.

2. The improvement defined in Claim 1 wherein the means in said data means further includes means for updating billing information as the mobile unit moves during a communication process.

3. The improvement defined in Claim 1 wherein the means in said

data means further includes means for providing billing information for the mobile unit according to where service is provided so that more than one cellular communications system can share the revenue associated with a communication process.

4. The improvement defined in Claim 3 wherein the means for providing billing information according to where service is provided includes means for updating billing information as the mobile unit moves during a communication process.

5. The improvement defined in Claim 1 wherein the data means includes means for accepting the communication process if the mobile unit is within a prescribed geographic area.

6. The improvement defined in Claim 1 wherein the data means includes means for rejecting the communication process if the mobile unit is outside the prescribed geographic area.

7. A wireless over-the-air communications system that includes one or more cell sites, an MTSO, locating means in the cellular communications system for determining the exact geographic location of a mobile unit and for providing a position signal of said exact geographic location, means in the MTSO for recognizing the position signal and using that position signal to establish the exact geographic location of the mobile unit, and data means in the MTSO responsive to the locating means for altering a frequency used for the communication process based on the exact

geographic location of the mobile unit, said means for altering communication process frequency including tables containing authorized frequencies for the cellular communication system and positional data and means for comparing the exact geographic location of said mobile unit to the tables and selecting a frequency to use for the communication process made by said mobile unit based on said exact geographic location.

8. The wireless over-the-air communications system defined in Claim 7 wherein said data means further includes means for generating billing information based on geographic location of the mobile unit.

9. A wireless over-the-air communications system that includes one or more cell sites, an MTSO, locating means in the cellular communications system for determining the exact geographic location of a mobile unit and for providing a position signal of said exact geographic location, means in the MTSO for recognizing the position signal and using that position signal to establish the exact geographic location of the mobile unit, and data means in the MTSO responsive to the locating means for directing a communication process to a specific cell site based on the exact geographic location of the mobile unit, said data means including tables containing positional data for service boundaries and means for comparing the exact geographic location of said mobile unit to the tables and selecting a specific cell site to handle the communication process based on said exact geographic location

of the mobile unit.

10. The wireless over-the-air communications system defined in Claim 9 wherein said data means includes means for generating a communication process record for each communication process.

11. The wireless over-the-air communications system defined in Claim 9 wherein said data means includes means for redirecting a communication process to a second cell site.

12. The wireless over-the-air communications system defined in Claim 9 wherein said data means further includes means for redirecting a communication process to another cellular system.

13. The wireless over-the-air communications system defined in Claim 9 wherein said data means further includes means for altering the frequency of a communication process during the communication process.

14. The wireless over-the-air communications system defined in Claim 1 wherein said data means further includes means for changing the cell site during the communication process.

15. The wireless over-the-air communications system defined in Claim 14 wherein said data means further includes means for changing wireless over-the-air communication systems during the communication process.

16. In a wireless over-the-air communications system that includes one or more intra-system cell sites, a system boundary and an MTSO, the wireless over-the-air communications system being located adjacent to at least one neighboring wireless over-the-air wireless communication system having its own cell sites which are inter-system cell sites with respect to the wireless over-the-air communications system, the wireless over-the-air communications system being authorized to provide service to communication processes handled by the intra-system cell sites, the wireless over-the-air communications system and the neighboring wireless over-the-air carrier being subject to inter-system interference, locating means in a mobile unit of a wireless over-the-air communications system for determining the exact geographic location of the mobile unit and for providing a position signal of said exact geographic location; means in the MTSO for recognizing the position signal transmitted by the mobile unit and using that position signal to establish the exact geographic location of the mobile unit vis à vis cell sites in the wireless over-the-air communications system; and data storage and comparison means in the MTSO storing intra-system cell site location data giving a geographic location for each of the intra-system cell sites in the wireless over-the-air communications system and effecting a comparison between said position signal and the cell site location data of the intra-system cell sites and selecting a chosen cell site for use by said mobile unit based on said comparison and establishing communication between said mobile unit and said chosen cell site based on the exact

geographic location of the mobile unit if said chosen cell site is an intra-system cell site for reducing interference between said wireless over-the-air communications system and a neighboring wireless over-the-air carrier, the improvement in combination therewith comprising:

means in said data storage and comparison means for providing billing information based on the location of the mobile unit when a communication process is originated.

17. The wireless over-the-air communications system defined in Claim 16 wherein the means in said data storage and comparison means further including means for updating billing information as the mobile unit moves during a communication process.

18. The wireless over-the-air communications system defined in Claim 16 wherein the means in said data storage and comparison means further including means for providing billing information for the mobile unit according to where service is provided.

19. The wireless over-the-air communications system defined in Claim 16 wherein the locating means includes a satellite communications system.

20. The wireless over-the-air communications system defined in Claim 16 wherein the means in said data storage and comparison means further includes means for changing the frequency of the communication process during the communication process.

21. A method of making communication process management decisions in a wireless over-the-air communications system having a plurality of cell sites at various locations and an MTSO including:

- A) establishing an exact geographic location for a mobile unit;
- B) matching the geographic location of the mobile unit to service boundary information, and selecting a cell site based on such matching;
- C) using the selected cell site matched to the mobile unit to handle communication processes associated with the mobile unit; and
- D) using the geographic location of the mobile unit for billing.

22. The method defined in Claim 21 wherein the step of using the geographic location of the mobile unit for billing includes changing the billing rates during the communication process.

23. A method of making communication process management decisions in a wireless over-the-air communications system having a plurality of cell sites at various locations and an MTSO comprising:

- A) establishing an exact geographic location for a mobile unit; and
- B) establishing a frequency for use in handling a communication process made by the mobile unit based on the geographic location of the mobile unit.

24. A method of making communication process management decisions in a wireless over-the-air communications system having a plurality of cell sites at various locations and an MTSO comprising:

- A) establishing an exact geographic location for a mobile unit making a communication process;
- B) establishing a billing record upon which taxes can be assessed based on the location of the mobile unit when the communication process originated.

25. The method defined in Claim 24 further including updating the billing records for updating tax assessment as the mobile unit moves during the communication process.

26. A method of making communication process management decisions in a wireless over-the-air communications system having a plurality of cell sites at various locations and an MTSO comprising:

- A) establishing an exact geographic location for a mobile unit;
- B) establishing override criteria which directs communication processes away from a specific cell site; and
- C) directing the communication process to the specific cell site, and then re-directing the communication process away from that specific cell site based on the override criteria.

27. A method of making communication process management decisions in two wireless over-the-air communications systems each of which has a plurality of cell sites at geographic locations and an MTSO

comprising:

- A) establishing an exact geographic location for a mobile unit;
- B) matching the geographic location of the mobile unit to a service boundary information, and selecting a cell site based on such matching;
- C) using the selected cell site to handle communication processes associated with the mobile unit;
- D) using the geographic location of the mobile unit for billing;
- E) directing the billing to the appropriate wireless over-the-air communications system authorized to handle communication processes in the particular geographic location of the mobile unit; and
- F) continuously updating the geographic location of the mobile unit during the communication process whereby each of the cellular systems will bill for any portion of the communication process carried out in its territory regardless of where the communication process originated.

28. A method of making communication process management decisions in two wireless over-the-air communications systems each of which has a plurality of cell sites at various locations and an MTSO comprising:

- A) locating at least one cell site from one of the wireless over-the-air communications systems in the geographic area of the other wireless over-the-air communications system;
- B) establishing an exact geographic location for a mobile unit;

- c) matching the geographic location of the mobile unit to service boundary information, and selecting a cell site based on such matching;
- d) using the selected cell site to handle communication processes associated with the mobile unit;
- e) using the geographic location of the mobile unit for billing;
- f) directing the billing to the appropriate wireless over-the-air communications system authorized to handle communication processes in the particular geographic location of the mobile unit; and
- g) continuously updating the geographic location of the mobile unit during the communication process whereby each of the wireless over-the-air communications systems will bill for any portion of the communication process carried out in its territory regardless of where the communication process originated.

29. A method of making communication process management decisions in two wireless over-the-air communications systems comprising:

- a) establishing a shared cell site;
- b) sharing the cell site by both of the wireless over-the-air communications systems;
- c) establishing an exact geographic location for a mobile unit;
- d) matching the geographic location of the mobile unit to service boundary information, and selecting a cell site based on such matching;
- e) using the selected cell site to handle communication

processes associated with the mobile unit;

F) using the geographic location of the mobile unit for billing;

G) directing the billing to the appropriate wireless over-the-air communications system authorized to handle communication processes in the particular geographic location of the mobile unit; and

H) continuously updating the geographic location of the mobile unit during the communication process whereby each of the wireless over-the-air communications systems will bill for any portion of the communication process carried out in its territory regardless of where the communication process originated even if the shared cell site is used.

30. A method of making communication process management decisions in two neighboring wireless over-the-air communications systems each having its own cell sites, comprising:

A) maintaining signal strength in all cell sites at a maximum permissible level for the area immediately adjacent to each cell site;

B) establishing an exact geographic location for a mobile unit;

C) matching the geographic location of the mobile unit to a cell site location, and selecting a cell site based on such matching; and

D) using the selected cell site matched to the mobile unit to handle communication processes associated with the mobile unit.

31. The improvement defined in Claim 1 wherein said locating means includes a satellite communication system for establishing an exact geographic location of said mobile unit.

32. The improvement defined in Claim 7 wherein said locating means includes a satellite communication system for establishing an exact geographic location of said mobile unit.

33. The improvement defined in Claim 9 wherein said locating means includes a satellite communication system for establishing an exact geographic location of said mobile unit.

34. The method defined in Claim 23 further including a step of changing frequency of the communication process as the mobile unit moves.

35. The method defined in Claim 26 further including a step of changing cell sites which handle the communication process from among cell sites owned by two different wireless over-the-air communications systems.

36. The method defined in Claim 27 further including a step of using a satellite to determine the exact geographic location of the mobile unit.

37. The method defined in Claim 28 further including a step of using a satellite to determine the exact geographic location of

the mobile unit.

38. The method defined in Claim 30 further including a step of using a satellite to determine the exact geographic location of the mobile unit.

39. The method defined in Claim 24 further including a step of using a satellite to determine the exact geographic location of the mobile unit.

40. The method of making communication process management decisions defined in Claim 21 further including a step of updating the billing as the mobile unit moves during the communication process.

41. The wireless over-the-air communications system defined in Claim 15 wherein said data means further includes means for changing frequency during the communication process.

42. The improvement defined in Claim 1 wherein the cell sites include at least one wireless system communications satellite.

43. The improvement defined in Claim 7 wherein the cell sites include at least one wireless system communications satellite.

44. The wireless over-the-air communications system defined in Claim 9 wherein the cell sites include at least one wireless

system communications satellite.

45. The wireless over-the-air communications system defined in Claim 16 wherein the cell sites include at least one wireless system communications satellite.

46. The method defined in Claim 21 wherein the cell sites include at least one wireless system communications satellite.

47. The method defined in Claim 23 wherein the cell sites include at least one wireless system communications satellite.

48. The method defined in Claim 24 wherein the cell sites include at least one wireless system communications satellite.

49. The method defined in Claim 26 wherein the cell sites include at least one wireless system communications satellite.

50. The method defined in Claim 27 wherein the cell sites include at least one wireless system communications satellite.

51. The method defined in Claim 28 wherein the cell sites include at least one wireless system communications satellite.

52. The method defined in Claim 29 wherein the cell sites include at least one wireless system communications satellite.

53. The method defined in Claim 30 wherein the cell sites include at least one wireless system communications satellite.

54. The method defined in Claim 21 further including a step of updating the exact geographic location of the mobile unit at selected intervals.

55. The method defined in Claim 23 further including a step of updating the exact geographic location of the mobile unit at selected intervals.

56. The method defined in Claim 24 further including a step of updating the exact geographic location of the mobile unit at selected intervals.

57. The method defined in Claim 26 further including a step of updating the exact geographic location of the mobile unit at selected intervals.

58. The method defined in Claim 27 further including a step of updating the exact geographic location of the mobile unit at selected intervals.

59. The method defined in Claim 28 further including a step of updating the exact geographic location of the mobile unit at selected intervals.

60. The method defined in Claim 29 further including a step of updating the exact geographic location of the mobile unit at selected intervals.

61. The method defined in Claim 30 further including a step of updating the exact geographic location of the mobile unit at selected intervals.

62. The improvement defined in Claim 1 further including means for updating the location of the mobile unit at selected intervals.

63. The wireless over-the-air communications system defined in Claim 7 further including means for updating the location of the mobile unit at selected intervals.

64. The wireless over-the-air communications system defined in Claim 9 further including means for updating the location of the mobile unit at selected intervals.

65. The improvement defined in Claim 16 further including means for updating the location of the mobile unit at selected intervals.

## CELLULAR TELEPHONE SYSTEM THAT USES POSITION OF A MOBILE UNIT TO MAKE CALL MANAGEMENT DECISIONS

## ABSTRACT

A cellular telephone system has call management decisions made based on the exact geographic location of the mobile unit. These call management decisions include billing and taxing decisions, cell site selection, frequency selection and even cellular system selection. The decisions are continuously updated during a call whereby decisions can be made and changed regardless of where a call originated. Cell site location, and even cellular system selection, can be made in a specific manner to best serve the needs of the mobile user, the cellular system as well as the public. It is even possible for a cellular system to locate one or more of its cell sites in the geographic area served by another cellular system. In some cases, cellular systems might even share cell sites.

DECLARATION AND POWER OF ATTORNEY  
FOR PATENT APPLICATION

As below named inventors, we hereby declare that:

TYPE OF DECLARATION

This declaration is of the following type:

Utility

INVENTORSHIP IDENTIFICATION

Our residences, post office addresses and citizenships are as stated below next to our names.

We believe we are the original, first and joint inventors of the subject matter which is claimed and for which a patent is sought on the invention entitled:

CELLULAR TELEPHONE SYSTEM THAT  
USES POSITION OF A MOBILE UNIT  
TO MAKE CALL MANAGEMENT DECISIONS

SPECIFICATION IDENTIFICATION

the specification of which:

is attached hereto.

ACKNOWLEDGEMENT OF REVIEW OF PAPERS AND DUTY OF CANDOR

We hereby state that we have reviewed and understand the contents of the above identified specification, including the claims as amended by any amendment referred to above.

We acknowledge our duty to disclose information which is material to the examination of this application in accordance with Title 37, Code of Federal Regulations, Section 1.56 (a).

In compliance with this duty, there is attached an information disclosure statement. 37 CFR 1.97.

PRIORITY CLAIM

We hereby claim foreign priority benefits under Title 35, United States Code, Section 119 of any foreign application(s) for patent or inventor's certificate or of any PCT international application(s) designating at least one country other than the United States of America listed below and have also identified below any foreign application(s) for patent or inventor's certificate or any PCT international application(s) designating at least one country other than the United States of America

filed by us on the same subject matter having a filing date before that of the application(s) of which priority is claimed.

no such applications have been filed.

We hereby claim the benefit under Title 35, United States Code, §120 of any United States application(s) listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States application in the manner provided by the first paragraph of Title 35, United States Code §112, we acknowledge the duty to disclose information which is material to patentability as defined in Title 37, Code of Federal Regulations, §1.56 which became available between the filing date of the prior application and the national or PCT International filing date of this application.

The present application is a continuation-in-part of pending US Application Serial Number 08/555,884, filed 10/23/95 which is a continuation-in-part of US Application Serial Number 08/402,976, filed 03/13/95, which was a CIP of US Application Serial Number 07/813,495, filed 12/26/91, which is a continuation of US Application Serial Number 08/057,833, filed 05/07/93 which is a continuation of US application 07/813,494, filed 12/26/91 and issued as US Patent 5,235,633.

POWER OF ATTORNEY

As a named inventors, we hereby appoint the following attorney to prosecute this application and transact all business in the Patent and Trademark Office connected therewith.

Terry M. Gernstein  
Reg. No. 26,891

Send all correspondence to:

Terry M. Gernstein  
1015 Salt Meadow Lane  
McLean, VA 22101

Direct Telephone Calls to:

Terry M. Gernstein
